### Rationale

Computer Engineering benefits from Digital signal processing, through its application in the transformation, synthesis and analysis of data. For example, when modelling a communication channel, filters, generators and analyzers can be used to remove, add or measure noise in processing audio, images and video. The computer engineer to-be therefore has to have a thorough introduction to Digital signal processing.

### Course Content

#### 1. *History and Overview*

- Indicate some reasons for studying digital signal processing and multimedia
- Highlight some people that influenced or contributed to the area of digital signal processing and multimedia
- Indicate some important topic areas such as digital audio, multimedia, wave tables, digital filters, image display, chromatic and achromatic lighting, and thresholds
- Contrast the meanings of analog and digital signals
- Explain the need for using transforms and why they are different for analog and discrete situations
- Indicate how the subject relates to simple graphics
- Contrast image processing from computer graphics
- Mention some techniques used in transformations such as Fourier, Laplace, and wavelet transforms
- Explore some additional resources associated with digital signal processing and multimedia

- Explain the purpose and role of digital signal processing and multimedia in computer engineering
2. **Theories and concepts**
    - The sampling theorem
    - Nyquist frequency
    - Aliasing
    - Relationship between time and frequency domain
    - Principle of causality such as discrete and continuous spectra
  3. **Discrete Fourier transform**
    - Definition of the Discrete Fourier Transform (DFT)
    - Relationship between original and transformed domains
    - Algorithms of the DFT
    - Linear convolutions
    - Contrast DFT with the Fourier Transform and the Fast Fourier Transform (FFT)
    - Filtering using DFT
    - Filtering of long data sequences
  4. **Digital spectra analysis**
    - Spectral views
    - Spectrum analysis
    - Spectra of periodic signals
    - Spectra of the impulse and a square wave
    - Filtering
    - Interpolation
  5. **Sampling**
    - Implications of assumptions of repeated time series
    - Group sampling of time signals
    - Size of group and how it affects spectra
    - Sampled signals
    - Periodic signals
    - Non-periodic signals
    - Spectrograms
  6. **Transforms**
    - Concept and properties of the z–transform
    - Inverse z–transforms
    - Difference equations
    - The Discrete Fourier Transform
    - The Inverse DFT
    - The Fast Fourier Transform Class
    - The Inverse FFT method
    - Fast Convolution using the FFT
    - Power Spectral Density
    - Frequency shifting using the FFT
    - Filtering using FFT
    - Additive and subtractive synthesis
  7. **Digital filters**
    - Frequency response of discrete – time systems

- Recursive filter design
  - Nonrecursive filter design
  - Windowing
  - FIR filters, frequency and phase response, time domain multi-tap filters, surface acoustic wave filters
  - Poles and zeros in the  $z$  plane
  - IIR filters, frequency and phase response
  - Design of IIR Filters
- 8. Discrete time signals**
- Representation of signals
  - Sampling of signals
  - Quantizing
  - Aliasing
  - Difference Equations
- 9. Window functions**
- Definition of a window function
  - Purpose of a window function
  - Signal compression and transform properties
  - Window functions and their impact on the spectra
  - Window functions and the DFT
- 10. Convolution**
- Impulse response
  - Convolution integral
  - Physically realizable systems
  - Graphical methods

### **Learning Outcomes**

- Identify some contributors to digital signal processing and multimedia and relate their achievements to the knowledge area.
- Know the difference between analog and discrete signals.
- Describe how computer engineering uses or benefits from digital signal processing and multimedia.
- Explain the purpose of a Fourier transform in signal processing.
- Describe the advantage of the FFT.
- Contrast how group size affects signal spectra.
- Understand the concept, properties and uses of the  $z$ -transform.
- Understand the relationship between  $z$ -transform and the conformal map
- Understand the Discrete Fourier transform and its significance.
- Understand frequency selective filters in the  $z$ -transform domain.
- Understand the definition of a window function.
- Understand the discrete-time representation of signals.
- Use the convolution technique to analyze circuits.
